# PRODUCTION AND EVALUATION OF SOME PRODUCTS PREPARED FROM IMMATURE ZAGLOUL DATE (Phoenix dactylifera)

Abo Samaha, O. R.; E. M. Abou-Tour and A. A. Abdel-Nabey Dept. of Food Sci. & Technology, Fac. of Agric., Alex. Univ., Alex. Egypt

#### **ABSTRACT**

Zagloul date palm (*Phoenix dactyllifera*) is widely cultivated in Egypt. The immature dates (Kimri stage) with less commercial value were used for processing into date pickle, date jam and candied/ glazed/ chocolate coated dates. Chemical composition, and changes occurred during the pickling process were determined. pH, tannins and pectin were dropped gradually and a gradual increase in titratable acidity expressed as % lactic acid was noticed. The aforementioned products were found to be acceptable with respect to colour, taste, texture, odour and overall acceptability. These results showed that acceptable and nutritious zagloul date products can be prepared and marketed as specialty products.

**Keywords:** Date pickle Date jam, Candied date.

#### INTRODUCTION

Date (*Phoenix dectylifera*) is an important commercial crop in the Middle East and Arab countries especially Egypt. Date fruit is a rich source of carbohydrates comprising mainly of sugars and dietary fibre, making it one of the most nourishing natural foods available to the human. Dates are also a good source of vitamins and minerals such as P, Fe, K and a significant amount of Ca. (Kulkarni *et al.*, 2008 and Kulkarni *et al.*, 2010).

Dates are consumed fresh (Al-Hooti *et al.*, 1997-a); dried (Kulkarni *et al.*,2008); and processed in the form of paste (Mustafa *et al.*, 1986); Jams (Mustafa *et al.*,1983); juice concentrate (Kulkarni *et al.*,2010); glace (Sawaya *et al.*,1986); drinks (El-Shaarawy *et al.*, 1986); syrup (dibis) (Abd El-Mohsen and Nezam El-Din., 1995); chutney and date relish (Al-Hooti *et al.*,1997-b).

In addition, dates can be used in manufacturing several products such as liquid sugar, vinegar, alcohol, yeast, confectionery and pickles (Al-Ogaidi et al.,1982; Khalchadourian et al., 1983; Hamad et al.,1983; Dowson and Aten, 1962; Hamad and Yousif., 1986; Hamad et al., 1986; Moustafa et al., 1986, El-Shimi and Hashimi, 1992 and Yousif and Al-Ghamdi, 1999).

The development of date fruits is divided into four stages named by their Arabic denomination, kimri, khalal, rutab and tamr. At the kimri stage, there is a rapid increase in size, weight and reducing sugars. It is the period of highest acid activity and moisture content (up to 85%). All factors level off at the end of this stage when the fruit starts to turn yellow or red according to variety. At this stage tannins will start to precipitate and lose their astringency which makes the date already palatable (Al- Hooti *et al.*, 1997b).

Zagloul date represents the major type of soft dates. This type of date grows well in El-Behera governorate (Edkou and Rosetta zones). The

period between maturing and ripening expands from May to October. The environmental, soil, and water conditions as well as exposure to insects and birds affect the load of the date palm tree. At the kimri stage zagloul palm trees lose at least 15 - 20% of its load underneath the trees.

Very little work has been done regarding the utilization of zagloul date underneath the trees during the kimri (green) stage. So, the objectives of the present work were to utilize this type of date to produce value added products such as date pickles, date jam, candied/ glazed/ chocolate coated dates.

#### **MATERIALS AND METHODS**

#### Materials:

Freshly immature zagloul dates were obtained from a farm In Edkou, Al-Behera governorate at the beginning of the third week of July, 2010. Zagloul date fruits underneath the trees were collected always between 6 to 7 in the morning and transported directly to the laboratory for the experimental studies. The date fruits were sorted, washed and used for the processing into pickles, Jam, candied and glace dates.

#### Methods:

#### **Physical Characteristics:**

A random sample of 20 fruits of zagloul date were examined for fruit shape, colour, weight, length, width and percentage of flesh as well as calyx (cap) and pit (seed). Colour values of dates were measured by Lovibond schofield tintometer. Number/kg and bulk density were also determined.

#### **Technological methods:**

Fig. (1) illustrates the flow sheets followed for preparing date pickles, date jam and candied/ glazed/ chocolate coated date products.

#### Chemical analysis:

Proximate analysis of zagloul date including moisture, crude protein (N  $\times$  6.25), crude ether extract, total ash and crude fibre were carried out according to the AOAC (1990) procedures. Carbohydrates were calculated by difference. Minerals (Fe, Cu, Mg, Ca, Mn, Zn, Cd and Pd) were measured as described in the AOAC (1990) using perkin Elmer Atomic Absorption spectrophotometer (Model 2380). On the other hand, Na and K. were determined using flame photometer Model PEP7. Total soluble solids (TSS) at 20°C were determined by pocket refractometer (Model 2 WAJ; China). pH was measured by Cole Parmer pH meter. Titratable acidity as % lactic acid, pectin, tannins as % tannic acid by Folin Ciocaltu method after extracting with 70% ethanol were determined as described by Ranganna (1977). Total sugars (reducing and non-reducing) were determined using Lane and Enon procedure as stated in AOAC (1990).

J. Food and Dairy Sci., Mansoura Univ., Vol. 2 (10), October, 2011

Fig. (1) Flow sheets of Zagloul date products
1- Slow open kettle process
(Minifie 1982)

2- Quick process

#### **Sensory evaluation:**

Colour, taste odour, texture, appearance and overall acceptability of date pickle, date jam and candied/ glazed date were assessed using well trained panelists of Food Science and Technolog Dept., Alex. Univ., Egypt and hedonic scale rating test as described by Ranganna (1977), was used.

#### Statistical analysis:

Data were transformed using square root then analyzed using randomized complete block design (R.C.B.D.). Least significant differences at 0.05 probability level (L.S.D. 0.05) was used to compare between means of the studied treatments according to Steel and Torrie (1980).

#### RESULTS AND DISCUSSION

#### Physical properties of zugloul date:

General appearance of green zagloul date in the kimri stage is shown in Fig. (2). It can be noticed that zagloul date has oblong shape. The fruits were mildly sweet with a note of astringency. The physical characteristics of fresh immature zagloul date are presented in Table (1). The weight of single fruits ranged from 7.8 to 8.2 g. The length and width ranged from 3.59 – 3.61 cm and 1.92 – 1.96 cm, respectively. The number of fruits per kilogram was 127. The results obtained in the present study agreed well with those reported by Sawaya *et al* (1983)., (1986). The edible portion of zagloul date varied between 7.42 to 7.82g. On the other hand, the pit (seed) and calyx (cap) content varied from 0.34 to 0.42 g representing about 3.5% of the total weight of the fruit.

#### Chemical composition of zagloul date

The composition of the fresh immature zagloul dates is presented in Table (2).

Table (1): Physical characteristics of freshly immature zagloul date fruits

Character*	Value
Total weight (g)	7.9 ± 0.10
Length (cm)	3.5 ± 0.08
Width (cm)	1.94 ± 0.10
Number per Kg	127 ± 2.0
Bulk density (g/ cm³)	0.65 ± 0.01
Lovibond reading	
Blue	$6.0 \pm 0.02$
Yellow	$6.5 \pm 0.05$
Red	2.7 ± 0.03
Weight of flesh (g)	7.62 ± 0.06
Weight of calyx and pit (g)	0.28 ± 0.03
% of flesh	96.46 ± 0.03
% of calyx and pit	$3.54 \pm 0.02$

<sup>\*</sup> Means ± S.D.

Fig. (2) General appearance of freshly immature zagloul date fruits

Data in Table (2) indicated that moisture was the major component of green zagloul date. Therefore, It was subjected for rapid deterioration if it was kept at room temperature, thus processing of immature zagloul date fruits might reduce their losses. Generally, green zagloul date contained relatively higher values of crude protein and crude fibre being 8.12 and 11.72%, respectively (on dry weight basis). Slightly lower values of crude ether extract and total ash were noticed. The results indicated that freshly immature zagloul date fruits are rich in carbohydrates. Total sugars (reducing) were 7.45%. No reducing sugars were detected in zagloul date at kimri stage. The results obtained here are in a good agreement with those reported by Ragab et al., (1956) and Abdalla et al (2008). Results in Table (2) also showed that green zagloul date fruits had higher content of Na, K and Mg. Meanwhile, Ca, Zn, Fe, Cu and Mn were found in lower concentrations. These results agreed well with those reported by Farag (2004) and Abdalla et al (2008).

### Changes in physicochemical properties of zagloul date during pickling process

The effect of pickling process on the PH, titratable acidity, pectin and tannins of green zagloul date fruits is shown in Table (3).

As shown in Table (3), PH, pectin and tannins decreased, while titratable acidity of date fruits and brining solution increased during the pickling period. It well known that during pickling process lactic acid content

increased due to fermentation of sugars by natural flora present. At the same time, according to reverse osmosis, salt (Na Cl) transfers from the brining solution into the fruits itself. It can be noticed that green zagloul date fruits contained about 0.86% tannins as tannic acid. After four days in brining solution, tannins decreased to 0.34%. These results agreed well with the results obtained by Ragab *et al* (1956). On the other hand, pectin decreased from 0.33% to 0.19 after 4 days in brining solution. It has been noticed that the outer skins of green zagloul date fruits were loosed in the brining solution. This indicates the end of the fruits stage of pickling in which the fruits starts to turn greenish yellow and lose their astringency which makes the dates already palatable. Also at this stage, insoluble pectin gradually converted into soluble pectin. This may be due to pectin esterase which converts insoluble pectic substances into more soluble pectin contributing to softness of the fruit (Al-Ogaidi *et al*, 1982 and Hamad and Yousif, 1986).

#### Sensory evaluation of zagloul date products

The general appearance of zagloul date products are shown in Figs. (3, 4).

#### A- Date Pickle

The sensory evaluation of the finished product of date pickle is shown in Table (4).

Table (4): Changes in sensory properties of date pickle during storage\*

Storage period	Storage period Characters				Overall	
(work)	Colour	Taste	Texture	Odour	Acceptability	
2	8.13 <sup>a</sup>	7.60 <sup>a</sup>	8.20 <sup>a</sup>	7.87 <sup>a</sup>	8.0 <sup>a</sup>	
4	8.0a	7.86a	8.13 <sup>a</sup>	7.93 <sup>a</sup>	8.07 <sup>a</sup>	
6	8.13 <sup>a</sup>	7.86a	8.33 <sup>a</sup>	8.00 <sup>a</sup>	8.20 <sup>a</sup>	
8	8.46a	7.93 <sup>a</sup>	8.06 <sup>a</sup>	8.33a	8.27 <sup>a</sup>	

<sup>\*</sup> Means in the same column followed by the same letter(s) are not significantly different according to L.S.D. values 0.05

It was obvious that panelists accepted the green zagloul date pickle kept in the pickling solution even after 8 weeks of storage at ambient temperature ( $22 \pm 2$ °C).

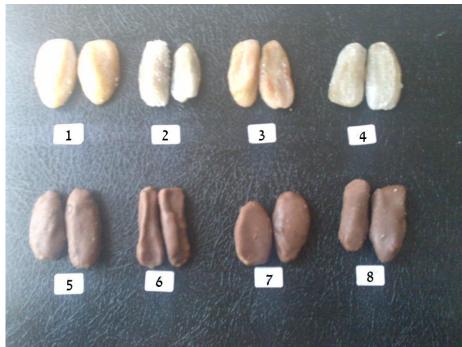

The panelists did not notice any significant differences in the studied organoleptic properties during this storage period.

#### B- Date Jam

The sensory evaluation of the finished products of date jam is shown in Table (5).

Fig (3): General appearance of date pickle (1) and date Jam (2)

ual <del>c</del>					
Tested Products		Cha	Overall		
rested Products	Colour	Taste	Texture	Odour	Acceptability
Mashed without Flavoring agent	7.73ª	8.27 <sup>ab</sup>	8.33 <sup>ab</sup>	8.27ª	8.07 <sup>b</sup>
Mashed with Flavoring agent	6.80 <sup>b</sup>	7.73 <sup>b</sup>	7.80 <sup>b</sup>	7.20 <sup>b</sup>	7.47 <sup>b</sup>
Halves	8.4ª	8.80 <sup>a</sup>	8.67 <sup>a</sup>	8.80 <sup>a</sup>	9.13 <sup>a</sup>
L.S.D 0.05	0.91	0.67	0.68	0.62	0.83

Means in the same column followed by the same letter(s) are not significantly different according to L.S.D. values 0.05

As shown from Table (5), Panelists accepted all the jam products prepared either in mashed form or in halves. The overall acceptability of jam containing extracts of cinnamon and cloves was less acceptable comparing with the other two jam products. No significant differences were noticed in colour, taste, odour and texture between mashed date jam without flavouring agent and date jam in halves.

#### C- Candied/ glazed/ chocolate coated date products

The sensory evaluation of the finished products of candied / glazed/chocolate coated date products is shown in Table (6).

According to the obtained data it can be noticed that candied, Chocolate coated as well as candied, glazed and chocolate coated date products prepared by the two processes (slow open kettle process and the quick process) were more acceptable than the candied date only or the candied and glazed date products. The results indicated that glazing process followed by chocolate coating improved the organoleptic properties of candied date produced by the aforementationed processes. Also, the data revealed that no significant differences were noticed between candied chocolate coated and candied glazed chocolate coated date products prepared either by the slow or the fast process.

Table (6): Organoleptic Properties of Candied/ glazed/ chocolate coated date products\*

	uato pi cuacto					
	Tooted Deadwate		Char	Overall		
	Tested Products	Colour	Taste	Texture	Odour	Acceptability
Can	died					
1-	Slow process	6.30°	6.85 <sup>b</sup>	7.15 <sup>b</sup>	6.85 <sup>b</sup>	6.20 <sup>b</sup>
2-	Fast process	7.30 <sup>b</sup>	6.50 <sup>b</sup>	7.35 <sup>b</sup>	7.06 <sup>b</sup>	6.80 <sup>b</sup>
Candied glazed

2-	Fast	8.40a	7.70 <sup>ab</sup>	8.05 <sup>ab</sup>	7.95 <sup>a</sup>	8.15 <sup>a</sup>
Can	died, glazed and chocolate coated					
1-	Slow	8.65 <sup>a</sup>	8.05 <sup>a</sup>	7.85 <sup>a</sup>	8.40 <sup>a</sup>	8.45 <sup>a</sup>
2-	Fast	8.50 <sup>a</sup>	8.40 <sup>a</sup>	8.15 <sup>a</sup>	8.25 <sup>a</sup>	8.40 <sup>a</sup>
	L.S.D. 0.05	0.67	0.71	0.78	0.71	0.86

Means in the same column followed by the same letter(s) are not significantly different according to L.S.D. values 0.05

2- Quick process

It may be concluded that date pickle, date jam as well as candied/glazed/ chocolate coated date products with desirable sensory quality could be prepared from immature green zagloul date underneath the trees fruits (Kimri stage).

## إنتاج وتقييم بعض المنتجات المحضرة من ثمار بلح الزغلول في مرحلة ما قبل النضج

أسامة راشد أبو سماحة، السيد محمد أبو طور ، على أحمد عبد النبى قسم علوم وتكنولوجيا الأغذية – كلية الزراعة – جامعة الإسكندرية

تنتشر زراعة نخيل الزغلول في جمهورية مصر العربية. ولقد تم الإستفادة من ثمار الزغلول المتساقطة تحت الأشجار في مرحلة ما قبل النضج (مرحلة الكمرى) لإنتاج بلح مخلل، مربى البلح والبلح المسكر. هذا وقد تم دراسة التركيب الكيماوي وكذلك دراسة التغيرات الحادثة أثناء مرحلة تخليل البلح الزغلول.

ولقد أثبتت الدراسة حدوث انخفاض تدريجي في رقم الحموضة ونسبة كل من التانينات والبكتين في حين حدثت زيادة تدريجية في نسبة الحموضة التنقيطية محسوبة كحامض لاكتيك وذلك أثناء عملية التخليل. ولقد وجد أن جميع المنتجات المحضرة لاقت قبولاً جيداً من حيث خواصها الحسية والتي تشمل اللون، الطعم، القوام، الرائحة، ودرجة التقبل العام.

كما أثبتت الدراسة إمكانية تحضير منتجات ذات قيمة غذائية ومقبولة حسياً من ثمار البلح الزغلول المتساقطة تحت الأشجار في مرحلة ما قبل النضج بحيث يمكن تسويقها على أنها منتجات خاصة.

الكلمات الدليلية: البلح المخلل، مربى البلح، البلح المسكر
